Preface xvii

1 Overview 1

1.1 The legacy of Maxwell 1

1.2 The legacy of Newton 2

1.3 The need for a geometric framework 3

2 Minkowski Spacetime 7

2.1 4-vectors 7

2.2 Transformation of gradients 11

2.3 Transformation matrix 13

2.4 Tensors 17

2.4.1 The energy-momentum stress tensor 17

2.5 Electrodynamics 19

2.5.1 4-currents and 4-potentials 19

2.5.2 Electromagnetic field tensor 21

2.6 Conservation of $T^{\alpha\beta}$ 21

3 The Effects of Gravity 27

3.1 The principle of equivalence 27

3.2 The geodesic equation 30

3.3 The metric tensor 33

3.4 Variational calculation of the geodesic equation 36

3.5 The Newtonian limit 37

4 Tensor Analysis 43

4.1 Transformation laws 43
4.2 The covariant derivative 47
4.2.1 Contravariant vectors 47
4.2.2 Transformation of the affine connection 48
4.2.3 Covariant vectors 49
4.2.4 Tensors of arbitrary rank 50
4.2.5 Going from special to general relativity 51
4.2.6 The affine connection and basis vectors 52
4.3 Identities of tensor calculus 54
4.4 Hydrostatic equilibrium 59
4.5 Covariant differentiation and parallel transport 61

5 The Curvature Tensor 63

5.1 Commutation rule for covariant derivatives 63
5.2 The curvature tensor via basis vectors 65
5.3 Round trip by parallel transport 66
5.4 Geodesic deviation 69
5.5 Algebraic identities of $R^{\sigma}{}_{\nu\lambda\rho}$ 70
5.5.1 Remembering the curvature tensor formula 70
5.5.2 $R_{\lambda\mu\nu\kappa}$: Fully covariant form 70
5.5.3 How many independent components does the curvature tensor have? 72
5.6 The Ricci tensor 73
5.7 Curvature and Newtonian gravity 75
5.8 The Bianchi identities 76
5.9 The Einstein field equations 78
5.10 A Lorentz-invariant gravitational pseudotensor 82
5.11 Field equations from local inertial coordinates 84
5.12 Variational derivation of the field equations* 85
5.12.1 Matter stress tensor from a variational principle 86
5.12.2 The gravitational action 87
5.12.3 Conservation of $T^{\mu\nu}$ 89

6 Schwarzschild Black Holes 91

6.1 Schwarzschild metric 91
6.2 Schwarzschild metric in Cartesian coordinates 97
6.3 The Schwarzschild radius 98
6.4 Birkhoff's theorem 102
6.5 The metric determinant and mass 104
6.6 Schwarzschild spacetime 105
6.6.1 Radial photon geodesic 105
6.6.2 Orbital equations 107
6.7 The deflection of light by an intervening body 111
6.8 The perihelion advance of Mercury 115
6.8.1 Newtonian orbit limit 116
6.8.2 Relativistic corrections to the orbit of Mercury 118
6.9 General solution for Schwarzschild orbits* 122
6.9.1 Formulation 122
6.9.2 Solution 123
6.10 Gravitational collapse* 125
6.11 Shapiro delay: The fourth protocol 128

7 Kerr Black Holes 133

7.1 Vacuum rotating spacetime: Kerr metric 133
7.2 Boyer-Lindquist coordinates 136
7.3 Kerr geometry 138
7.3.1 Singularities 138
7.3.2 Stationary limit surface: $g_{00} = 0$ 139
7.3.3 Event horizon: $g^{rr} = 0$ 140
7.3.4 The angular velocity of the outer event horizon 142
7.4 The Penrose process 143
7.4.1 Energy and angular momentum transferral 143
7.4.2 Relation to the Hawking area theorem 145
7.5 Orbital equations 145
7.6 Stable circular and quasi-circular orbits* 147
7.6.1 Stable circular orbits 147

7.6.2 Quasi-circular orbits 150
7.6.3 From Schwarzschild to maximally spinning Kerr black hole 152

8 Self-Gravitating Hydrostatic Equilibrium 155

8.1 Relativistic stellar structure 155
8.2 Fundamentals 158
8.3 Constant-density stars 161
8.4 Tolman's method* 164
8.5 White dwarfs 167
8.6 Neutron stars 172
8.7 The physics of neutron star matter: A descriptive overview 179

9 Gravitational Radiation 183

9.1 Overview 184
9.2 The linearized gravitational wave equation 185
9.2.1 The harmonic gauge 185
9.2.2 Review of the retarded wave solution 192
9.3 Plane waves 194
9.3.1 The transverse-traceless (TT) gauge 195
9.4 The quadrupole formula 197
9.5 Radiated energy 199
9.5.1 Scalar theory 199
9.5.2 Energy flux for linearized gravity 201
9.6 Radiated quadrupole energy for gravitational waves 204
9.7 Gravitational radiation from binary stars 208
9.7.1 Orbital energy loss 208
9.7.2 Angular momentum loss* 213
9.8 Detection of gravitational radiation 218
9.8.1 Preliminary comments 218
9.8.2 Indirect methods: Orbital energy loss in binary pulsars 222

9.8.3 Direct methods: LIGO 225
9.8.4 Direct methods: Pulsar timing array 229

10 Cosmology 235

10.1 A dynamic Newtonian universe 235
10.1.1 Equation of motion 237
10.1.2 Cosmological redshift 238
10.2 Cosmology models for the impatient 239
10.2.1 The large-scale spacetime metric 239
10.2.2 The Einstein–de Sitter universe: A classic benchmark model 241
10.2.3 The growth of density perturbations in an expanding universe 244
10.3 The Friedmann-Robertson-Walker metric 247
10.3.1 Maximally symmetric 2-spaces 247
10.3.2 Maximally symmetric 3-spaces 249
10.4 Large-scale dynamics 253
10.4.1 The effect of a cosmological constant 253
10.4.2 Formal analysis 254
10.4.3 The Ω_0 parameter 258
10.5 The classic, matter-dominated universes 260
10.6 Our Universe 263
10.6.1 A Universe of ordinary matter and vacuum energy 264
10.6.2 Radiation-dominated era 267
10.7 Observational foundations of cosmology 271
10.7.1 The discovery of cosmological redshifts 271
10.7.2 The cosmic distance ladder 272
10.7.3 The parameter q_0 273
10.7.4 The redshift–magnitude relation 275
10.8 The cosmic microwave background radiation (CMB) 279
10.8.1 Overview 279
10.8.2 An observable cosmic radiation background: The Gamow argument 283
10.8.3 The cosmic microwave background (CMB): Subsequent developments 286

10.9 Thermal history of the Universe 288
10.9.1 Preliminaries 288
10.9.2 Classical cosmology: Helium nucleosynthesis 290
10.9.3 Neutrino and photon temperatures 292
10.9.4 Ionization of hydrogen 294

11 Supplemental Topics* 297

11.1 The Oppenheimer-Snyder problem 297
11.2 The energy and angular momentum of black hole spacetimes 302
11.3 Particle production and event horizons 304
11.3.1 Minkowski and Rindler metrics 306
11.3.2 Scalar field equation 307
11.3.3 Review of quantum field theory 308
11.3.4 Bogoliubov formalism 310
11.3.5 Invariant inner product 311
11.3.6 Minkowski and Rindler vacuums 314
11.3.7 The Hawking effect 317
11.3.8 Hawking luminosity and Bekenstein-Hawking entropy 318
11.4 The Raychaudhuri equation 320
11.5 The focusing theorem 324
11.5.1 WKB solutions of the Maxwell equations 324
11.5.2 The governing equation 326
11.5.3 Proof of the theorem 329
11.6 Effects of electric charge 331
11.6.1 The Reissner-Nordström metric 331
11.6.2 Singular metric structure: Wormholes and white holes 333
11.6.3 Naked singularities 334
11.7 Derivation of the Hellings-Downs curve 334
11.8 An effective Newtonian potential for weak gravitational radiation 337

11.9 Inflationary models 340
11.9.1 "Clouds on the horizon" 340
11.9.2 The stress-energy tensor of a scalar field 341
11.9.3 Effective potentials in quantum field theory 345
11.9.4 The slow-roll inflationary scenario 347
11.9.5 Inflated expectations 351
